

Abstract

A catheter set comprising a catheter and a package for storing of the catheter before use and for collecting or discharging urine, wherein an ~~elongated~~ ^{elongated} part of the package forms a tube and wherein the catheter has a proximal part to be inserted into the urethra, a distal part in the form of a tubular section having an inner diameter at least as large as the inner diameter of the part of the proximal part of the catheter and a sealing part separating the proximal part of the catheter and the tubular distal part. The inventive shape of the catheter combined with the shape of the package prevents a blocking of the free flow of urine from the urethra into the package.
